BOOST EFFICIENCY AND REDUCE SPATTER IN MILD STEELS

WiseSteel

BOOST EFFICIENCY AND REDUCE SPATTER IN MILD STEELS

Optimized arc characteristics for different transfer modes make MIG welding of carbon steels easy and efficient with **WiseSteel**. For example, thanks to the intelligent control system, challenges related to the globular transfer are now tackled. This is achieved by alternating short arc transfer with spray transfer, which reduces spatter by up to 30%, increases travel speed, and produces high-quality welds characterized by regular fish-scale pattern.

In short-circuit transfer, WiseSteel adaptively improves the arc stability, thus providing better out-of-position welding capabilities. Moreover, micropulsing of the current and voltage in spray transfer mode constricts the arc increasing travel speed by up to 30%.

KEY BENEFITS

REDUCTION IN LABOR COSTS

Per welded meter compared to standard arc

REDUCTION IN GRINDING COSTS

Compared to standard MIG welding

SAVINGS IN STRAIGHTENING COSTS

Compared to standard MIG welding

BENEFITS

- Easier weld pool control in the PF position and precise heat input control on the weld pool sides, enabling higher travel speeds
- Less welding spatter and higher travel speed compared to standard globular arc welding
- High-quality welds with regular fish scale pattern in globular transfer mode
- In spray transfer mode, the welding speed increases and heat input decreases compared to standard spray arc welding because of precise micropulsing of the arc

PRODUCT OPTIONS

WiseSteel

A welding function especially designed to tackle the challenges of globular transfer. WiseSteel alternates short arc transfer with spray transfer, which produces sound welds characterized by a regular fish-scale pattern.

FEATURES

Less labor costs per welded meter

Thanks to micropulsing of the current and voltage and to simultaneous adaptive regulation, which keeps the arc optimally short, WiseSteel provides up to 30% faster travel speed in spray transfer compared to the standard arc. Faster welding speed equals more welded parts or structures per shift, i.e. lower labor costs per welded meter.

Savings in grinding costs

WiseSteel in the globular transfer area significantly reduces spatter and thus post-weld grinding work compared to standard MIG welding. This is achieved by alternating short arc transfer with spray transfer to reduce the droplet size, enabling welding also in the vertical and overhead positions.

Savings in straightening costs

WiseSteel's high-energy-density arc produces narrow, deep penetrating welds requiring 75–80% of the heat input needed for a comparable penetration with standard MIG in spray transfer mode. The lower heat input results in less distortion, which decreases the need for time-consuming flame straightening work.

WWW.KEMPPI.COM

Kemppi is the design leader in the arc welding industry. We are committed to boosting the quality and productivity of welding by continuous development of the welding arc and by working for a greener and more equal world. Kemppi supplies sustainable products, digital solutions, and services for professionals from industrial welding companies to single contractors. The usability and reliability of our products is our guiding principle. We operate with a highly skilled partner network covering over 70 countries to make its expertise locally available. Headquartered in Lahti, Finland, Kemppi employs close to 800 professionals in 16 countries and has a revenue of 195 MEUR in 2022.
